

A close-up, low-angle shot of a glowing incandescent light bulb. The bulb is the central focus, with its glass envelope and internal filament structure clearly visible. The filament is coiled and glows with a warm, yellow-orange light. The background is a solid, muted blue, which provides a strong contrast to the warm light of the bulb. The lighting is soft, highlighting the contours of the glass and the intricate details of the filament.

INCOME PREDICTOR

ALBERTO TORRES

DECISIONS

- Crossroad about going to college.
- Is the income after college worth it?
- Created a predicting model to forecast annual income for individuals with a college education.

VARIABLES

- Target Variable: Income >50K
- Education: Highest level of education individual achieved
- Occupation: Current work position
- Race
- Gender
- Relationship: If individual is a husband, wife, single, etc.
- Hours worked per week

A TOOL FOR EDUCATIONAL INSTITUTIONS

- With the predictive model, institutions can show students or potential students that in the long run a college education is the best route.
 - The model will try to predict if the individual has the potential to make more than 50 thousand a year.
 - Shows individuals a forecast of the future.
- 
- 

COLLEGE ENROLLMENT RATE DOWNFALL

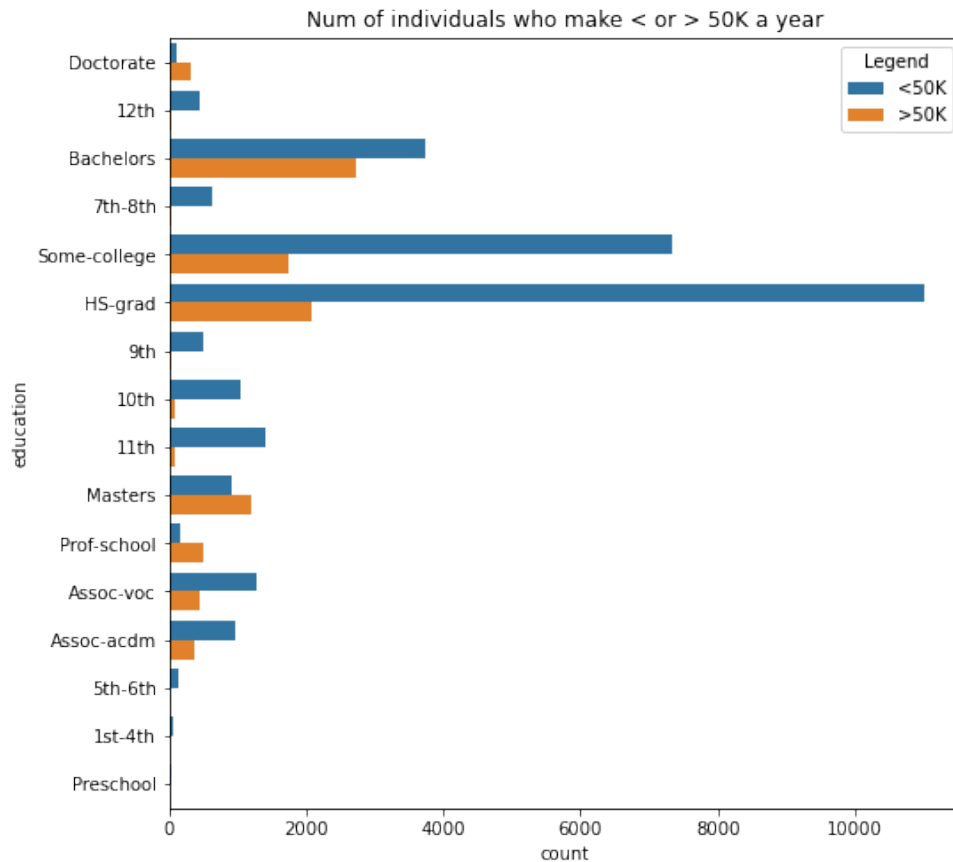

- Nearly one million less students enrolled in college in 2022 then before 2020.
- From 2019-2021 colleges seen undergraduate student enrollment fall by 6.6%.
 - Biggest decline in more than 50 years.

[Americans choose jobs over college : NPR](#)

SHORT-TERM BENEFITS VS. LONG-TERM BENEFITS OF A DEGREE.

- According to Georgetown University, bachelor's degree holders were found to "earn a median of \$2.8 million during their career, 75% more than if they had only a high school diploma."
- Many high school students go for short-term money rather than a long-term career and high wages.

DATA UNDERSTANDING

Machine learning model:

- Demonstrates who is making more money annually.
- Predictor takes in attributes such as education, relationship, hours worked, etc.
- In Dataset 9.6K/39.4K individuals made over 50K

DATA UNDERSTANDING CONT.

- Georgetown University study, HS-Grads are the ones earning less than 50K a year.
- There's more than 50% HS-grads that make less than 50K then someone that has their bachelor's degree.

PREDICTIVE MODEL

- Random Forest- is learning method for classification, regression and other tasks that operates by constructing a multitude of decision trees at training time.
- Accuracy on dataset: individual's who make <50K: 82%
- Accuracy on dataset: individual's who make >50K: 64%

THANK YOU, QUESTIONS?
